

Three things that separate a working assistant from one you'd trust

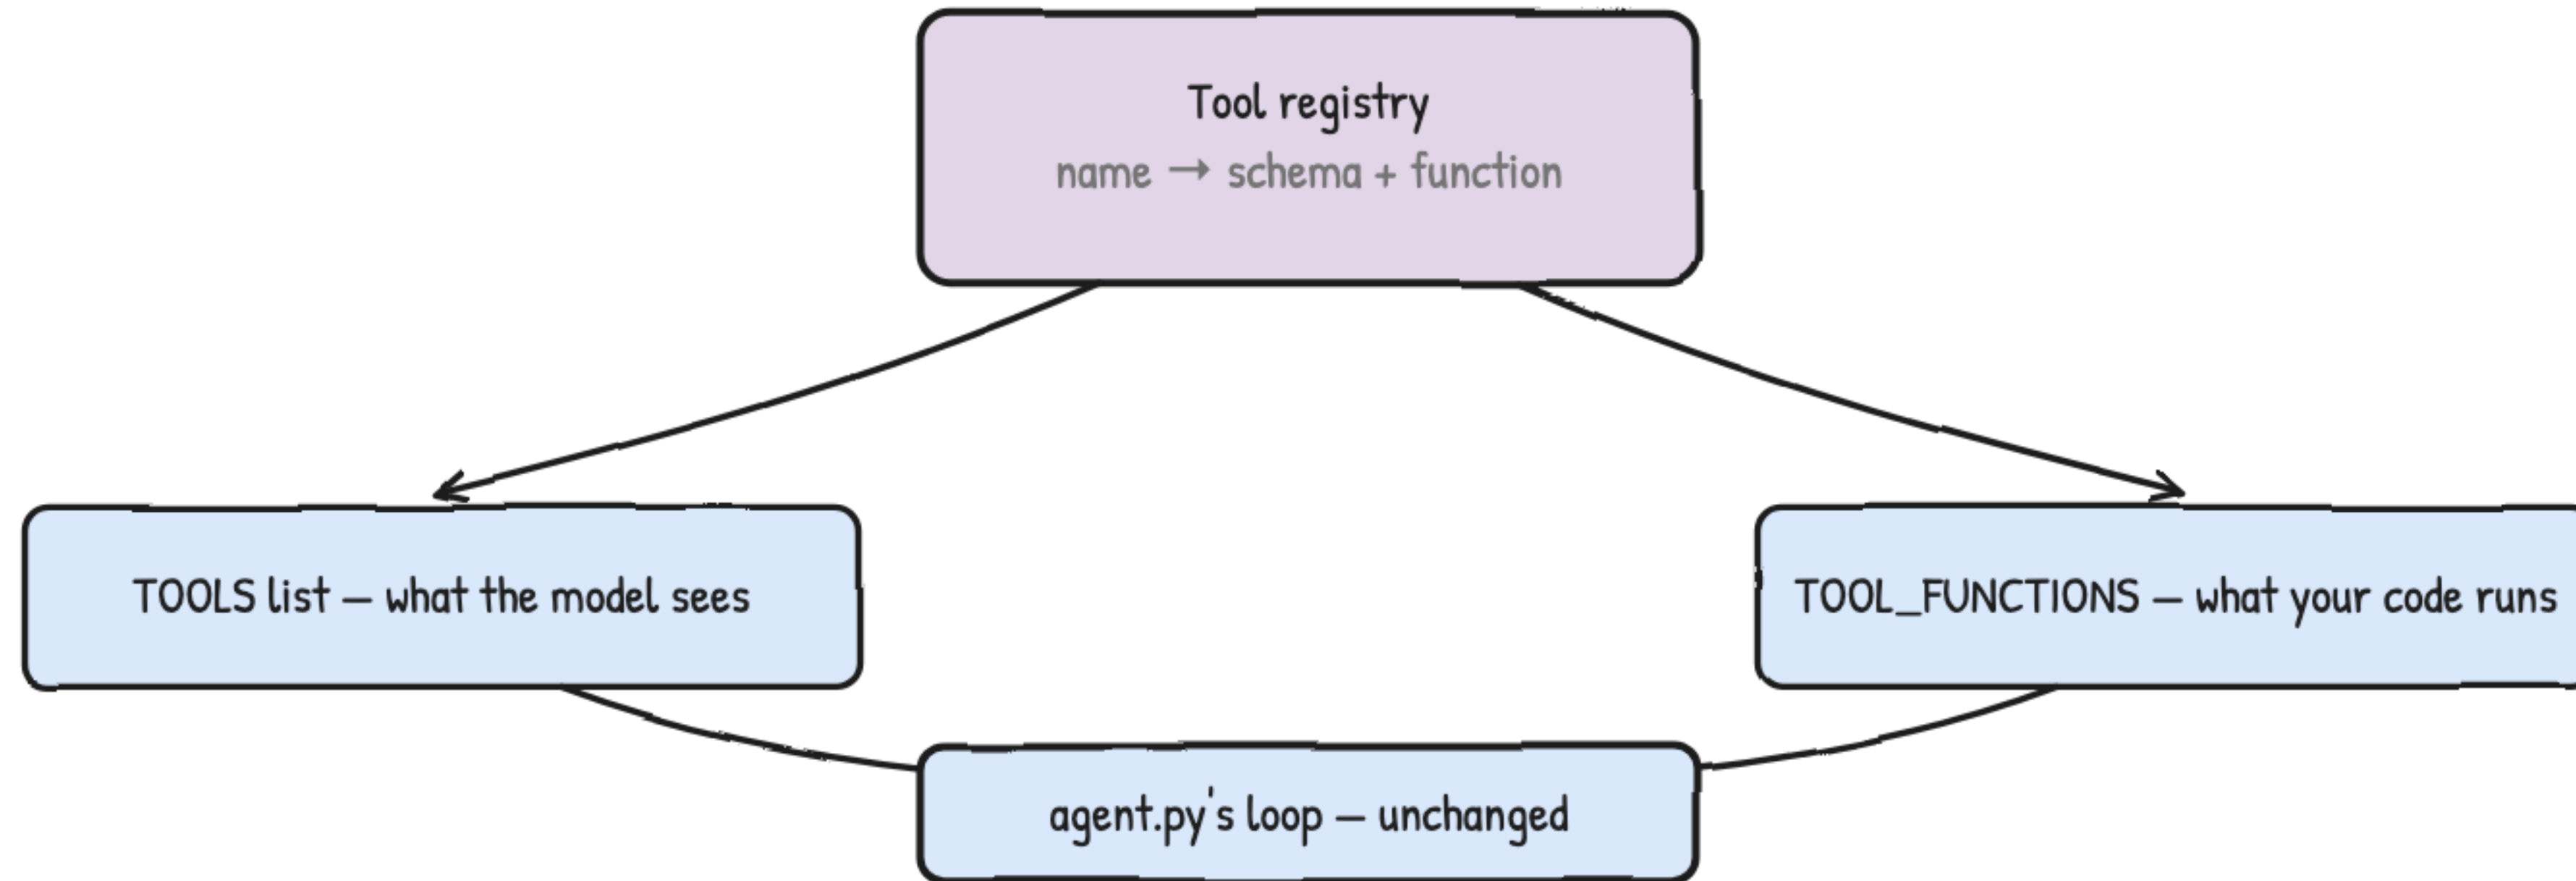

Proof, not a spot-check

Chunks arrive as they're ready, not all at once

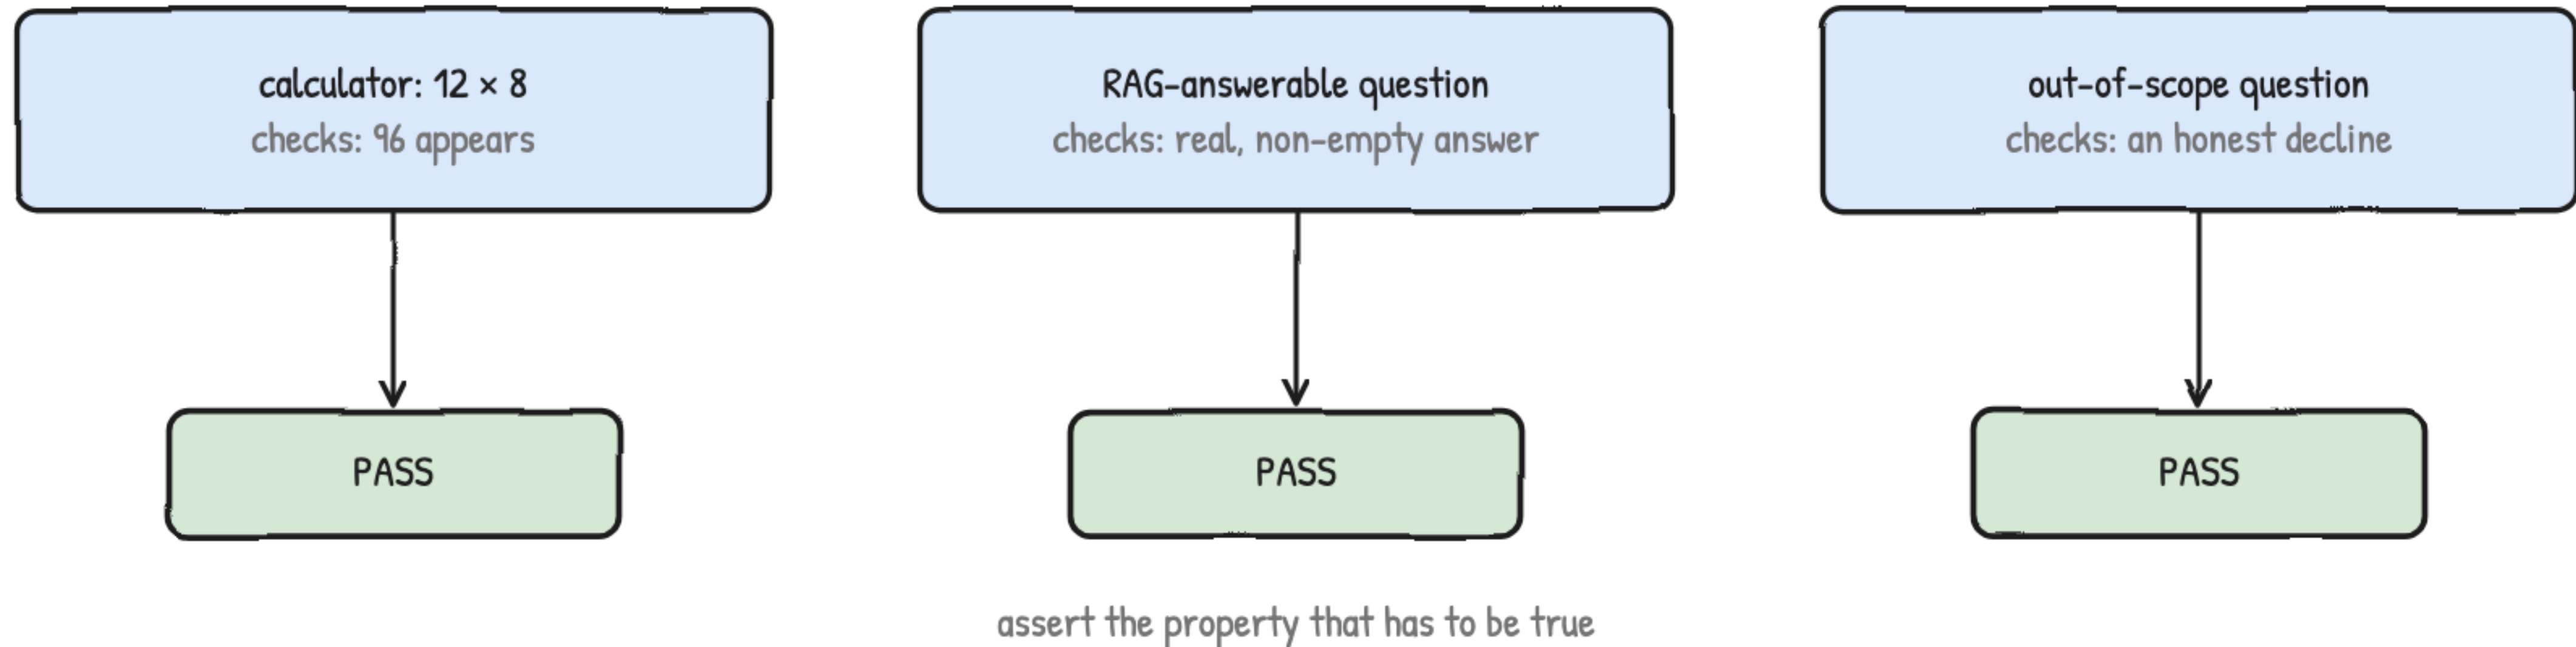

Something happening beats total silence.

One shared directory, not two hand-synced lists

One dict, keyed by name, two views generated from it.

Three fixed questions, checked by shape not exact wording

The right property held, not the exact sentence.

HAND-OFF TO THE TERMINAL

Run before you ship a prompt, tool, or provider change

- 1 stream only the final, no-more-tool-calls turn
- 2 a registry once past three or four tools, more than one owner
- 3 run the eval before a prompt, tool, or provider change ships

Gourav Shah · School of DevOps & AI · Now run `stream_chat.py`, `tool_registry.py`, then `eval_assistant.py`
