

MLOps, LLMOps & AgenticOps — The Deep Dive

Six things you've built. One question none answer.

Gourav Shah · School of DevOps & AI · Lesson + Lab + Quiz

Who actually runs this, once it's real?

Six real things you've built — none of them answer who keeps it running

- 1 predict a price (Module 3)
- 2 read a handwritten digit (Module 4)
- 3 call an LLM (Module 5)
- 4 decide its own next step (Module 6)
- 5 retrieve from a PDF (Module 6, bonus)
- 6 serve one behind an API (Module 7)

who keeps this running, once it's real?

What is MLOps, and how did it become LLMOps and AgenticAIOps?

The same DevOps loop, plus one part that moves on its own

That extra part is why MLOps exists

MLOps: DevOps discipline, aimed at data plus a trained model

Module 3 and Module 4 — a model you trained, from data you controlled

Module 3 and Module 4 — a model you trained yourself

LLMOps: same discipline, the artifact is a prompt now

you control the prompt and the context around it — not the model

Module 5 — you stopped training anything

AgenticAIOps: everything LLMOps covers, plus watching the loop

not just "is the answer right" — "did the loop behave"

Module 6 — an agent that decides its own next step

Each stage adds a layer — it never retires the one before it

Code only
the DevOps you know

Read left to right as what you're now responsible for

Each stage adds a layer — it never retires the one before it

Read left to right as what you're now responsible for

Each stage adds a layer — it never retires the one before it

Read left to right as what you're now responsible for

Each stage adds a layer — it never retires the one before it

Read left to right as what you're now responsible for

**MLOps vs. LLMOps vs. AgenticAIOps – and where
DevOps fits**

Three disciplines, three different jobs, on this course's own labs

A system rarely stays in exactly one row

Module 9's capstone needs all three, layered

What's the same between DevOps and MLOps

— almost everything

- 1 build
- 2 test
- 3 deploy
- 4 version control
- 5 monitor

MLOps doesn't throw any of this out

A code deploy is deterministic; a model's "build" isn't

a code deploy

the same commit produces the
same binary, every time

checked by a fixed
pass/fail test

a model's "build"

training — not fully deterministic,
can take hours instead of seconds

checked by an eval that
grades quality

It can go from working to wrong with zero code change

the model
byte-for-byte what you
shipped — nothing touched

the real world it predicts
against moved

wrong
with no code change at all

a pipeline that only watches "did the process crash" misses this completely

A crash-only pipeline misses this completely

The MLOps engineer sits between training and production

a platform-engineering job aimed at models instead of application code

Four things their pipeline actually gives you

- 1 automated retraining
- 2 a model registry — which version is actually live
- 3 deployment automation
- 4 monitoring + retraining triggers that catch drift before a customer does

the same DevOps muscle you already have, redirected at a different artifact

Real MLOps case studies, briefly

Click-through slid for two months before anyone noticed

a retail recommendation model
scored well in testing

click-through, quietly sliding, 2 months

nobody had wired up drift monitoring —
the first signal was a business metric, not an engineering one

fix

automated retraining triggered by
a drift threshold, not a calendar

One prompt edit fixed one complaint and broke a dozen others

Nine tool calls to do what should have taken two

an agent built to file tickets
automatically

9 tool calls — should have
taken 2, silently burning cost

only the final answer was logged, never each step

fix

step-level tracing — the Deep Dive
builds this out in full

Where the MLOps Bootcamp picks up

This module gave you the map — the Bootcamp builds the pipeline

the drift case

the prompt-regression case

the runaway-agent case

automated retraining, built end to end

an eval-gated deploy pipeline

step-level tracing

on a system that keeps running, not one you tear down after an hour

MODULE 8 TAKEAWAYS

You know what each discipline operates — today's lab instruments Module 7's own API

- 1 MLOps → LLMOps → AgenticAIOps
- 2 the three-way comparison
- 3 DevOps vs. MLOps + the MLOps engineer
- 4 three case studies + the Bootcamp bridge
